

# Hatch | Programming assignment

## Context

Your task is to test key functionality of one of the most popular social networking services – Twitter.

We do not expect all service functionality to be covered. In scope of this assignment only “Tweet” and “Re-Tweet” features.

Backend API specification for selected features is publicly available:

- [POST statuses/update](#)
- [POST statuses/retweet/:id](#)

We do not expect a production ready solution, but it should be a good working prototype with few test scenarios/cases put into code. You may use any publicly available open source tools and libraries, but we prefer if the solution is Java/Python based.

## Requirements

Self-contained Your submission should contain the following:

- Source code
- Short description of the implementation
- Instructions on how to run
- Test documentation

Good luck!
